# Birch: scope and intake

Birch is a fictional service for bus stop displays. A Birch request accepts at most 96 records. Input uses JSON Lines encoded as UTF-8. This is original synthetic test material, not the specification of a real product.

## Birch: execution

Birch has a processing timeout of 17 seconds. Network failures are retried at most 8 times with exponential backoff. Invalid data is never retried.
Duplicate requests are rejected using request_id.

# Birch: storage

Birch retains logs for 22 days. Guide A specifies a cache TTL of 180 seconds. The backup code is BIRCH-SAFE. Storage is in the local test region; no commercial geographic residency is promised.

# Birch: measurement table

Birch test results:

Metric | Value

Accuracy | 89%

Latency p95 | 81 ms

Recovery time | 38 seconds

The test uses exactly 200 requests at concurrency 1. The author invented these values for document-reading tests. They are not Subject Knowledge Hub benchmark results.

## Birch: unresolved disagreement

Guide B for Birch specifies a cache TTL of 195 seconds, unlike guide A. Neither guide has an effective date, so their precedence is unknown. Operators must verify the intended TTL. The document contains no rental price, support email address, or SLA.
