Maple: scope and intake

Maple is a fictional service for warehouse counters. A Maple request accepts at most 64 records. Input uses JSON Lines encoded as UTF-8. This is original synthetic test material, not the specification of a real product.

Maple: execution

Maple has a processing timeout of 13 seconds. Network failures are retried at most 6 times with exponential backoff. Invalid data is never retried.
Duplicate requests are rejected using request_id.

Maple: storage

Maple retains logs for 18 days. Guide A specifies a cache TTL of 120 seconds. The backup code is MAPLE-SAFE. Storage is in the local test region; no commercial geographic residency is promised.

Maple: measurement table

Maple test results:

Metric | Value

Accuracy | 90%

Latency p95 | 77 ms

Recovery time | 30 seconds

The test uses exactly 200 requests at concurrency 1. The author invented these values for document-reading tests. They are not Subject Knowledge Hub benchmark results.

Maple: unresolved disagreement

Guide B for Maple specifies a cache TTL of 135 seconds, unlike guide A. Neither guide has an effective date, so their precedence is unknown. Operators must verify the intended TTL. The document contains no rental price, support email address, or SLA.
