Willow: scope and intake

Willow is a fictional service for water meter readings. A Willow request accepts at most 128 records. Input uses JSON Lines encoded as UTF-8. This is original synthetic test material, not the specification of a real product.

Willow: execution

Willow has a processing timeout of 21 seconds. Network failures are retried at most 10 times with exponential backoff. Invalid data is never retried.
Duplicate requests are rejected using request_id.

Willow: storage

Willow retains logs for 26 days. Guide A specifies a cache TTL of 240 seconds. The backup code is WILLOW-SAFE. Storage is in the local test region; no commercial geographic residency is promised.

Willow: measurement table

Willow test results:

Metric | Value

Accuracy | 93%

Latency p95 | 85 ms

Recovery time | 46 seconds

The test uses exactly 200 requests at concurrency 1. The author invented these values for document-reading tests. They are not Subject Knowledge Hub benchmark results.

Willow: unresolved disagreement

Guide B for Willow specifies a cache TTL of 255 seconds, unlike guide A. Neither guide has an effective date, so their precedence is unknown. Operators must verify the intended TTL. The document contains no rental price, support email address, or SLA.
